

Chapter 5: Terraform tips and tricks

loops

count

- usage:

```
resource "blablabla" "blablabla_name" {  
  count = 3  
  name  = "bla${count.index}"  
}
```

- result: 3 elements ([0],[1],[2]) → resources array
- with length():

```
variable "bla_names" {  
  type    = list(string)  
  default = ["bla_green", "bla_yellow", "bla_red"]  
}  
resource "blablabla" "blablabla_name" {  
  count = length(var.bla_names)  
  name  = bla_names[count.index]  
}
```

- output
 - **[#]**: use cardinal to access a concrete element
 - **[*]**: all elements from resource list
- each element is assigned to their index in state, deletes o modifications implies «move» all elements after that.
- only usable for **resources**, no inline blocks

for_each

- lists (using **toset()** function), sets and maps
- for use in **resources** o **inline blocks**
- use **each.key** and **each.value**
- usage:

```
variable "bla_names" {  
  type    = list(string)  
  default = ["bla_green", "bla_yellow", "bla_red"]  
}  
resource "blablabla" "blablabla_name" {  
  for_each = toset(var.bla_names)  
  name    = each.value  
}
```

```
variable "bla_names" {  
  type    = map(string)  
  default = {"green" = "bla_green", "yellow" = "bla_yellow", "red" = "bla_red"}  
  #default = map("green", "bla_green", "yellow", "bla_yellow", "red", "bla_red")  
}
```

```

}
resource "blablabla" "blablabla_name" {
  for_each = toset(var.bla_names)
  name     = each.value
}

```

- **output:**
 - `values(<resource_name>)[*].attribute`

for

for string

conditionals

Pendiente

Pos 3500 aprox

count

```

variable "booleana" {
  type = bool
}
resource "resource" "resource_name" {
  count = var.booleana ? 1 : 0
  ...
}
variable "cadena" {
  type = string
  default = "aaa"
}
resource "resource" "resource_name" {
  count = format("%.1s", var.cadena) == "a" ? 1 : 0
}

```

for_each

if string
